

Running the floor from the app

Everything the crew does, plus the seven manager tabs behind the lock: where work is piling up, what to buy, what's in storage and where it went, and how to fix bad entries. Five minutes a day, twenty on Monday.

Open the app

Unlock **Daily and weekly** **The tabs** **Reading the numbers** **Fixing entries**
Storage and shipping **Counts** **When something looks wrong**

Unlock

1 Tap the  at the top right.

Type your name exactly as it appears in the crew list, then your PIN. Dan set it. The lock turns to  and seven more tabs appear.

2 Tap  to lock again when you're done on a shared phone.

Your own phone can stay unlocked. If the app ever drops you back to the crew view on its own, a PIN was changed: unlock again.

First, read the crew guide.

Everything there applies to you too, and you'll be the one explaining it. [Crew guide](#).

Daily and weekly

Every day, end of shift · 5 minutes

1. Floor tab. Where work is piling up, worst first. Anything red means five or more days to clear at the logged pace. Read the "how much to trust this" list at the

bottom before you act on a pile.

2. **Summary → Fix-ups.** Any entry logged twice shows here with a Reverse button. Tap it if it was a double-tap. Leave it if it was a real second batch.
3. **Overview.** Tomorrow's suggested numbers per station. Tap a target to change it.
4. **Receive** any deliveries that came in today.

Every Monday · 20 minutes

1. **Inventory → Count next.** Five materials the app most wants counted. Count them, type the real number, record.
2. **Inventory → Finished goods.** Count what's physically in storage per product and record it.
3. **Buy.** Anything under "Order these" grouped by supplier. **Copy order list** gives you the PO lines. Pass to Dan or place the order.
4. **Capacity.** Check the bottleneck per line and the crew rates. If a rate says "no hours", ask that person to log hours next week.

Monthly, or whenever the piles look wrong

1. **WIP → Walk the whole floor.** Count every pile at every station in one pass and submit once. This resets the pipeline to reality and clears every "logged out of order" warning.

The tabs

TAB	QUESTION IT ANSWERS	WHAT YOU DO THERE
Floor	Where is work piling up, how fast is each station going?	Read. Piles worst-first with days to clear; pace per station against target; finished per day.
Summary	How did the last 7 days go, and how much of it can I trust?	Read. Reverse repeated entries under Fix-ups. Export CSVs.
Overview	What's done, what's waiting, what should each station do	Tap a target number to change it.

tomorrow?

Capacity	What's the bottleneck, when could an order ship, who's fastest at what?	Use the promise calculator: product + quantity → working days and a date.
Receive	A delivery arrived. Put it on the shelf.	Material, quantity, PO number. Recent deliveries listed below.
Inventory	What's on the shelf, what's in storage, what's drifting?	Count materials and finished goods. Type the real number, leave the rest blank, record.
WIP	What's physically at each station right now?	Walk the floor and count. Resets the piles.
Buy	What runs out, when, and how much to order?	Order lists per supplier. "Order by" dates once lead times are filled in.

 Manager Floor tab with piles, pace by station, finished per day and a trust list

Floor, manager view

The crew sees only their own pace here. You see the whole shop.

 Buy tab with a supplier group, a shortfall and an order-by line

Buy

Short means the work already on the floor needs more than the shelf holds. "Order today" means you're late.

Reading the numbers

- **"12 short" / "5 extra."** Every difference is in words, never a signed number. Short means the shelf had less than the recipe predicted. Extra means more.
- **Pace is per active day.** Units divided by the days that station logged anything. Hours are thin, so units per hour is only shown where hours were entered.
- **Days to clear.** What's waiting at a station divided by that station's pace. No pace yet means nobody has logged that station recently.
- **"Stages logged out of order."** More units logged at a later station than at the one before it. Someone skipped a station on the phone, or the pile existed before the app did. The pile size is a guess until you walk the floor.

- **Likely duplicates.** Same person, product, station, quantity and day saved more than once. The Floor tab leaves them out of the numbers. Fix-ups on Summary is where you reverse them.
- **Never counted.** A material or product with no physical count yet. The first count sets the baseline. The variance on that first count means nothing; the second count is where drift becomes readable.
- **Confidence on Capacity.** "Thin" or "partial" means few days or few stations have a rate. Treat the promise date as rough.

Fixing entries

Double-tap or wrong number

Log My Day → set the date → tap the chip under Today's totals → how many to take back and why. Materials go back too.

Repeated entries across days

Summary → Fix-ups. One Reverse button per repeat. Reverses the extra copies only.

Piles that don't match the floor

WIP → Walk the whole floor. Counts win over the log from that moment on.

Shelf numbers that don't match

Inventory → type the real count → Record. The estimate restarts from your number and the variance is filed.

Never edit the sheet's log tabs by hand.

Deleting a row fixes the count but leaves the materials deducted forever. Every fix above puts things back properly.

Storage and shipping

Finished goods panel on the Inventory tab with storage, made, shipped and count columns

Finished goods

Top of the Inventory tab. Storage per product, made and shipped in the last 30 days, split by channel, last count, and a box to record a new count.

When a tube is logged as **Boxed** (or a chair or mat as Box) it lands in storage automatically. It leaves storage three ways:

- **The crew's Ship tab.** Product, quantity, channel, order number. This is the everyday path.
- **Shopify, automatically.** Fulfilled orders come in on their own every hour once Dan connects the store.
- **Amazon and QuickBooks orders.** Dan imports these from reports. If a shipment is already on file, importing it again changes nothing.

Produced minus shipped should equal what's in storage. When you count storage, the difference is the variance, and it's the number that tells you whether shipments are being recorded.

Counts

1 Pick who you are at the top of the form.

Counts are signed. Yours goes on the record.

2 Type only the numbers you actually counted.

A blank box means "didn't count", and that material is left alone. Zero means "I looked and there's none", and that counts.

3 Watch the difference appear as you type.

"That can't be right" costs nothing at the shelf and a walk back from the desk.

4 Record.

The estimate restarts from your number. Materials that miss the same way every time are the ones whose recipe is wrong; tell Dan.

Count next

on Inventory picks the five materials whose count is worth the most right now: never counted, negative, or drifting. Start there on Monday.

When something looks wrong

- **A tab says "Unknown action" or "backend is older than this app."** The sheet's code is behind. It updates itself within 30 minutes of a change. Wait, then reload. If it persists, tell Dan.
- **The footer says app and backend on different versions.** Normal for a few minutes after a change. Reload twice.
- **You got locked out.** A PIN changed, or Dan reset something. Tap  and unlock again.
- **A number is negative.** Materials: no opening count was ever taken. Storage: more shipped than was logged as finished. Count it, and the number resets.
- **The crew's entries look inflated.** Check Summary → Fix-ups first. Then the Floor tab's trust list.
- **The crew asks what changed.** The What's new tab is yours, not theirs: a dot on it means a version landed since you last looked. Tell them the crew lines in your own words.
- **Something else.** Tell Dan what tab, what you tapped, and what it said. A screenshot is the fastest way.
